

Lecture 6

Computer and Information Technology

Computer Peripherals: Input Devices (Part One)

Defining Input Devices

Input devices are pieces of equipment used to provide data and control signals to an information processing system such as a computer, smart phone, tablet or any information processing appliance.

Example: Keyboards, Mouse, Scanners, Digital Cameras, Joysticks, and Microphones.

TYPE OF INPUT DEVICES

Input Type = Text Device = Keyboard

Keyboard is the most common and very popular input device which helps to input data to the computer. The layout of the keyboard is like that of traditional typewriter, although there are some additional keys provided for performing additional functions.

Input Type = Text Device = Keyboard

S.No	Keys & Description
1	Typing Keys These keys include the letter keys (A-Z) and digit keys (09) which generally give the same layout as that of typewriters.
2	Numeric Keypad It is used to enter the numeric data or cursor movement. Generally, it consists of a set of 17 keys that are laid out in the same configuration used by most calculators.
3	Function Keys The twelve function keys are present on the keyboard which are arranged in a row at the top of the keyboard. Each function key has a unique meaning and is used for some specific purpose.
4	Control keys These keys provide cursor and screen control. It includes four directional arrow keys. Control keys also include Home, End, Insert, Delete, Page Up, Page Down, Control(Ctrl), Alternate(Alt), Escape(Esc).
5	Special Purpose Keys Keyboard also contains some special purpose keys such as Enter, Shift, Caps Lock, Num Lock, Space bar, Tab, and Print Screen.

Laser Projected
(Bluetooth)

Input Type = Text code

Device = Barcode reader

Bar Code Reader is a device used for reading bar coded data (data in the form of light and dark lines). Bar coded data is generally used in labelling goods, numbering the books, etc. Unique numeric codes can be coded into lines of varying thickness and spacing and can be read by projecting a LASER light onto that dark bars. This is a very fast method to input numeric codes into a computer.

QR Code

Input Type = Text code

Device = MICR

Magnetic Ink Character Reader (MICR)

MICR input device is used in banks as there are large number of cheques to be processed every day. The bank's code number and cheque number are printed on the cheques with a special type of ink that contains particles of magnetic material that are machine readable once magnetized. MICR can read text written with magnetic ink even with all the write overs and bank seals.

Input Type = Text

Device = OCR

Optical character recognition/reader or OCR is the electronic conversion of images of typed, handwritten or printed text into machine-encoded text, whether from a scanned document, a photo of a document, a scene-photo or from subtitle text superimposed on an image.

**DOCUMENT
SCAN**

**SCANNED
IMAGE FILE**

OCR
(Optical Character
Recognition)

**TEXT
DOCUMENT**

Input Type = Text

Device = OCR

At first, a document is scanned by any type of image scanner and an image file is produced. And then the OCR software uses its character recognition engine and artificial intelligence (AI) to recover the written text from it and generates a text file or in some cases a document file with all the text formattings.

Flatbed Scanner for OCR

Input Type = Text
Device = OCR

Handheld OCR

**Sheet fed Scanner
for OCR**

Input Type = Vote/Tally/Option Device = OMR

OMR stands for Optical Mark Recognition. This popular recognition technology is used for collecting data from “fill-in-the-bubble” forms such as educational tests, surveys, assessments, evaluations, and many other multiple choice forms. It requires a special type of form with pre-printed marks which are used to detect the position of user made black circles by the use of relative positioning algorithm.

Pre-Printed
Marks

The image shows a sample MCQ Answer Sheet. It features a vertical column of pre-printed marks on the left side, which are highlighted by a red box and a red arrow pointing to the 'Pre-Printed Marks' text. The form includes sections for 'REGISTER NUMBER', 'Date of Examination', 'INSTRUCTIONS TO CANDIDATE', 'ANSWERS', and 'Signature of the Candidate' and 'Signature of the Invigilator'. The 'ANSWERS' section contains a grid of bubbles for marking responses.

COLLEGE SEAL

REGISTER NUMBER

Date of Examination

Date Month Year

INSTRUCTIONS TO CANDIDATE

1. Use HB Pencil only for shading inside the Bubbles.
2. Use Ball Point Pen only to write in the Rectangle Boxes Provided
3. Write and shade your Register Number in the space provided.

Correct Method: (A) (B) (C) (D) Wrong Method: (X) (Y) (Z)

OMR vs. OCR

OMR

Optical Mark Recognition

It can only read the position of user made marks to identify MCQ choices or votes.

Using its recognition engine, OMR machines inputs votes, answers to MCQs into computer database automatically.

OMR requires special form with pre-printed marks so that it can use relative positioning technique and algorithm to pin point marking locations.

OCR

Optical Character Recognition or Reader

It can read hand written, typed or printed text in its supported languages.

OCR generates text or document files from images or scanned documents automatically.

OCR uses character recognition engine and advanced AI to recognize hard to detect writings.
